EVOLUTION IN DENTAL CARE

Edited by Richard J. Elderton, BDS., PhD., Professor of Preventive and Restorative Dentistry, University of Bristol.

High quality oral health care is an increasingly important aspiration in most parts of the world. However, the world is an ever-changing place and change in dentistry is occuring very rapidly indeed. All dental personnel need to know what is over the horizon so that they can attune their training and their practices for the future.

The rapid growth in knowledge of oral diseases, the changes in disease prevalence and distribution and the continued improvement in world communication make this a challenging time in modern dentistry.

All involved in dentistry world-wide will need increasingly to face up and to make far-reaching decisions that will markedly change the oral health of future generations and the shape of oral health care provision. Such change will be a long-term process with major ramifications for the training of dentists and for their future roles and those of other oral health personnel.

These and many other issues are dealt with in EVOLUTION IN DENTAL CARE. This book is based on the deliberations of the international conference 'Decisions in Forward-looking Oral Health Care' (University of Bristol, September 1988). Professor Elderton has carefully edited the text to provide a concise, readable account which will allow ready assimilation of the important issues raised and discussed by a team of international authorities on oral health care.

EVOLUTION IN DENTAL CARE is written for everyone with an interest in the future of oral health care from current oral health personnel, research workers in dental and allied fields, academics, health services personnel and administrators to patients—the consumers who stand to gain most from the evolutionary trends considered in this book. For the benefit of non-specialist readers a short glosary of dental terminology is provided.
